

Parallel Computing for Science & Engineering CS395T

3/23/23

Instructors:
Lars Koesterke, TACC

Example code

Work-sharing Constructs and Implied Barriers

- Worksharing Constructs
 - Do/For
 - Single
 - Sections
- Constructs without a Barrier
 - Critical
 - Atomic
 - Master
 - etc.

```
!$OMP PARALLEL shared(a)
```

```
...
```

Is this code correct?

```
a = 5.
```

```
!$OMP DO
```

```
do i=1, n
```

```
    b(i) = a
```

```
enddo
```

```
...
```

```
!$OMP END PARALLEL
```

```
!$OMP PARALLEL shared(a)
```

...

```
a = 5.
```

```
!$OMP DO  
do i=1, n  
    b(i) = a  
enddo
```

...

```
!$OMP END PARALLEL
```

Is this code correct?

All threads will execute a = 5.

How can we fix this?

```
!$OMP PARALLEL shared(a)
```

```
...
```

```
!$OMP CRITICAL
```

```
a = 5.
```

```
!$OMP END CRITICAL
```

```
!$OMP DO
```

```
do i=1, n
```

```
    b(i) = a
```

```
enddo
```

```
...
```

```
!$OMP END PARALLEL
```

Is there a Barrier needed at the end of the Critical Region?

Why is this solution incorrect/not optimal?

```
!$OMP PARALLEL shared(a)
```

...

What is the implicit Barrier doing?

```
!$OMP SINGLE
```

```
a = 5.
```

```
!$OMP END SINGLE
```

```
!$OMP DO
```

```
do i=1, n
```

```
    b(i) = a
```

```
enddo
```

...

```
!$OMP END PARALLEL
```

```
!$OMP PARALLEL shared(a)
```

```
...
```

```
!$OMP MASTER
```

```
a = 5.
```

```
!$OMP END MASTER
```

```
!$OMP DO
```

```
do i=1, n
```

```
    b(i) = a
```

```
enddo
```

```
...
```

```
!$OMP END PARALLEL
```

Would this work, too?
